Respiration and Crop Productivity Jeffrey S. Amthor, 2012-12-06 Respiration is a large and important component of the carbon economy of crops There are already several good books dealing with the biochemistry and physiology of plant respiration but there are none I know of that are devoted to the relationship between respiration and crop productivity although this relationship is more and more frequently being studied with both experiment and simulation Crop physiology books do cover respiration of course but the treatment is limited The purpose of the present book is to fill this void in the literature The approach taken here is to use the popular two component functional model whereby respiration is divided between growth and maintenance components After thoroughly reviewing the literature I came to the conclusion that at present this is the most useful means of considering respiration as a quantitative component of a crop's carbon economy This functional distinction is used as the framework for describing respiration and assessing its role in crop productivity Discussions and critiques of the biochemistry and physiology of respiration serve primarily as a means of more fully understanding and describing the functional approach to studying crop respiration It is assumed that the reader of this book is familiar with the fundamentals of plant physiology and biochemistry The research worker in crop physiology should find

this an up to date summary of crop respiration and the functional model of respiration This book is not however a simple review of existing data **A Research Guide to the Health Sciences** Kathleen J.
