Artificial Intelligence And Cognitive Sciences:

Foundational Issues in Artificial Intelligence and Cognitive Science Mark H. Bickhard, L. Terveen, 1995-03-07 The book focuses on a conceptual flaw in contemporary artificial intelligence and cognitive science Many people have discovered diverse manifestations and facets of this flaw but the central conceptual impasse is at best only partially perceived Its consequences nevertheless visit themselves as distortions and failures of multiple research projects and make impossible the ultimate aspirations of the fields The impasse concerns a presupposition concerning the nature of representation that all representation has the nature of encodings encodingism Encodings certainly exist but encodingism is at root logically incoherent any programmatic research predicted on it is doomed to distortion and ultimate failure The impasse and its consequences and steps away from that impasse are explored in a large number of projects and approaches These include SOAR CYC PDP situated cognition subsumption architecture robotics and the frame problems a general survey of the current research in AI and Cognitive Science emerges Interactivism an alternative model of representation is proposed and examined

Cognitive Sciences Maria Nowakowska, 2014-05-10 Cognitive Sciences Basic Problems New Perspectives and Implications for Artificial Intelligence presents models and theories that describe and analyze some selected topics in the cognitive sciences and their implications for artificial intelligence AI These topics range from problems of observability and its restrictions or distortions of the subjective perception of time to visual perception memory and communication Extensive use is made of fuzzy set theory Comprised of six chapters this volume begins with an introduction to the distortion of time perception and the

relationship between objective and subjective time An explanatory concept used here is that of a pre event being a candidate for an event to be stored in memory and the concept of a dynamic event representation of an object events on events generated by the perceiver in the process of perceptual work The discussion then turns to the notion of an event that underlies the theory of time the semantics of multimedial languages of verbal and non verbal communication and problems of the mechanisms underlying the formation of judgments as well as the problems of expression of these judgments in forms ranging from simple answers to binary questions and the generation of texts or discourses The book also considers memory and perception before concluding with a description of stochastic models of expertise formation opinion change and learning

Artificial Intelligence in Psychology Margaret A. Boden, 1989 This collection of Margaret Boden's essays written between 1982 and 1988 focuses on the relevance of artificial intelligence to psychology With her usual clarity and eye for the key role that each discipline plays in the science of the mind Boden ties the essays together in a thorough synoptic overview She outlines the various approaches from Babbage's contributions through the work of Turing and von Neumann to the latest theories of parallel processing and the questions that researchers in AI and psychology must ask to ascertain if there might be a discipline termed computational psychology Many theoretical psychologists today believe that the science of artificial

intelligence can include all of the phenomena generated by the human mind. This functionalist approach views the mind as a representational system and psychology as the study of the various computational processes whereby mental representations are constructed, organized, and interpreted. Disagreements abound, however, about how various psychological phenomena can be explained in computational terms; there is disagreement too about which AI concepts and which of the computer modeling methodologies will prove most useful from the psychologist's point of view. All of these issues are raised and clearly investigated here. The essays include: Fashions of Mind; Is Computational Psychology Constructivist? Does Artificial Intelligence Need Artificial Brains? Intentionality and Physical Systems; Escaping from the Chinese Room; Is Equilibration Important? Artificial Intelligence and Biological Intelligence; Educational Implications of Artificial Intelligence. Margaret A. Boden is Professor of Philosophy and Psychology and Founding Dean of the School of Cognitive Sciences at the University of Sussex. Artificial Intelligence in Psychology is included in the series Explorations in Cognitive Science, A Bradford Book. **Artificial Intelligence and Cognitive Science**, Readings in Cognitive Science Allan Collins, Edward E. Smith, 2013-10-02. Readings in Cognitive Science: A Perspective from Psychology and Artificial Intelligence brings together important studies that fall in the intersection between artificial intelligence and cognitive psychology. This book is composed of six chapters and begins with the complex anatomy and physiology of the human brain. The next chapters deal with the components of cognitive science such as the semantic memory similarity and analogy and learning. These chapters also consider the application of mental models which represent the domain specific knowledge needed to understand a dynamic system or natural physical phenomena. The remaining chapters discuss the concept of reasoning, problem solving, planning, vision, and imagery. This book is of value to psychologists, psychiatrists, neurologists, and researchers who are interested in cognition.

Understanding Representation in the Cognitive Sciences Alexander Riegler, Markus Peschl, Astrid von Stein, 2007-08-26. Currently a paradigm shift is occurring in the conventional understanding of representation which the traditional view of the brain as a container. The paper also summarizes the rationale for representing the things of the world as the selection of contributions to this volume which challenged in several respects. The present volume will roughly proceed from relatively realistic representations placed at the edge of this transition. Based on theceptions of representation to more constructivist 1997 conference New Trends in Cognitive Science interpretations. The final chapter of discussions presented in Vienna, Austria, it tries to collect and in taped during and at the end of the conference provide evidence from various disciplines such as provides the reader with the possibility to reflect upon philosophy of science, neuroscience, computational, the different approaches and thus contributes to better approaches psychology, semiotics, evolutionary, and more integrative understanding of their biology, social psychology, etc. to foster new thoughts and ideas understanding of representation. The subjective experience of an outside world. This book has a truly interdisciplinary character. It seems to suggest a mapping process where environments are presented in a form that is readily accessible to mental entities are projected into our mind via some professionals and students alike.

The Mind in Action Alan Garnham, 2016-07-15 Cognitive science which draws on ideas from psychology philosophy linguistics and artificial intelligence AI attempts to explain our mental life within a scientific framework Its goal is thus to remove the last major obstacle to a unified scientific account of the natural world In this title originally published in 1991 Alan Garnham provides an invaluable introduction to this exciting new development in the study of mind The Mind in Action focuses on the development of a systematic explanation of cognition rather than on facts about the way we perceive things remember them talk about them think about them and interact with them The author looks in detail at the nature of scientific explanations the reasons for developing them and the way they are assessed He describes the work carried out by cognitive scientists and considers the questions that motivate it He introduces the computational metaphor for the mind and explains how flushing out the metaphor might lead to an integrated scientific account of mental phenomena Designed primarily for people about to embark on courses in cognitive science and related disciplines The Mind in Action captures the liveliness and excitement of debates about the mind It is readily accessible to anyone with an interest in how the mind works avoiding technical terms where possible and explaining them fully where they are necessary

The Artificial Life Route to Artificial Intelligence Luc Steels, Rodney Brooks, 2018-05-14 Originally published in 1995 this volume is the direct result of a conference in which a number of leading researchers from the fields of artificial intelligence and biology gathered to examine whether there was any ground to assume that a new AI paradigm was forming itself and what the essential ingredients of this new paradigm were A great deal of scepticism is justified when researchers particularly in the cognitive sciences talk about a new paradigm Shifts in paradigm mean not only new ideas but also shifts in what constitutes good problems what counts as a result the experimental practice to validate results and the technological tools needed to do research Due to the complexity of the subject matter paradigms abound in the cognitive sciences connectionism being the most prominent newcomer in the mid 1980s This workshop group was brought together in order to clarify the common ground see what had been achieved so far and examine in which way the research could move further This volume is a reflection of this important meeting It contains contributions which were distributed before the workshop but then substantially broadened and revised to reflect the workshop discussions and more recent technical work Written in polemic form sometimes criticizing the work done thus far within the new paradigm this collection includes research program descriptions technical contributions and position papers
