Artificial Mind System Tetsuya Hoya, 2005-08-25 This book is written from an engineer's perspective of the mind Artificial Mind System exposes the reader to a broad spectrum of interesting areas in general brain science and mind oriented studies In this research monograph a picture of the holistic model of an artificial mind system and its behaviour is drawn as concretely as possible within a unified context which could eventually lead to practical realisation in terms of hardware or software With a view that the mind is a system always evolving ideas inspired by many branches of studies related to brain science are integrated within the text i e artificial intelligence cognitive science psychology connectionism consciousness studies general neuroscience linguistics pattern recognition data clustering robotics and signal processing

Learning Approaches in Signal Processing Wan-Chi Siu, Lap-Pui Chau, Liang Wang, Tieniu Tang, 2018-12-07 Coupled with machine learning the use of signal processing techniques for big data analysis Internet of things smart cities security and bioinformatics applications has witnessed explosive growth This has been made possible via fast algorithms on data speech image and video processing with advanced GPU technology This book presents an up to date tutorial and overview on learning technologies such as random forests sparsity and low rank matrix estimation and cutting edge visual signal processing techniques including face recognition Kalman filtering and multirate DSP It discusses the applications that make use of deep learning convolutional neural networks random forests etc The applications include super resolution imaging fringe projection profilometry human activities detection capture gesture recognition spoken language processing cooperative networks bioinformatics DNA and healthcare

Logical Foundations for Rule-Based Systems Antoni Ligeza, 2006-01-25 Thinking in terms of facts and rules is perhaps one of the most common ways of approaching problem definition and problem solving both in everyday life and under more formal circumstances The best known set of rules the Ten Commandments have been accompanying us since the times of Moses the Decalogue proved to be simple but powerful concise and universal It is logically consistent and complete There are also many other attempts to impose rule based regulations in almost all areas of life including professional work education medical services taxes etc Some most typical examples may include various codes e g legal or tra c code regulations especially military ones and many systems of customary or informal rules The universal nature of rule based formulation of behavior or inference principles follows from the concept of rules being a simple and intuitive yet powerful concept of very high expressive power Moreover rules as such encode in fact functional aspects of behavior and can be used for modeling numerous phenomena

Foundations and Novel Approaches in Data Mining Tsau Young Lin, Setsuo Ohsuga, Churn-Jung Liau, Xiaohua Hu, 2005-11-03 Data mining has become a popular research topic in recent years for the treatment of the data rich and information poor syndrome Currently application oriented engineers are only concerned with their immediate problems which results in an ad hoc method of problem solving Researchers on the other hand lack an understanding of the practical issues of data mining for real world

problems and often concentrate on issues that are of no significance to the practitioners In this volume we hope to remedy problems by 1 presenting a theoretical foundation of data mining and 2 providing important new directions for data mining research A set of well respected data mining theoreticians were invited to present their views on the fundamental science of data mining We have also called on researchers with practical data mining experiences to present new important data mining topics

Physics of the Human Temporality Ihor Lubashevsky, Natalie Plavinska, 2021-10-21 This book presents a novel account of the human temporal dimension called the human temporality and develops a special mathematical formalism for describing such an object as the human mind One of the characteristic features of the human mind is its temporal extent For objects of physical reality only the present exists which may be conceived as a point like moment in time In the human temporality the past retained in the memory the imaginary future and the present coexist and are closely intertwined and impact one another This book focuses on one of the fragments of the human temporality called the complex present A detailed analysis of the classical and modern concepts has enabled the authors to put forward the idea of the multi component structure of the present For the concept of the complex present the authors proposed a novel account that involves a qualitative description and a special mathematical formalism This formalism takes into account human goal oriented behavior and uncertainty in human perception The present book can be interesting for theoreticians physicists dealing with modeling systems where the human factor plays a crucial role philosophers who are interested in applying philosophical concepts to constructing mathematical models and psychologists whose research is related to modeling mental processes

Genetic Systems Programming Ajith Abraham, 2008-07-21 Designing complex programs such as operating systems compilers filing systems data base systems etc is an old ever lasting research area Genetic programming is a relatively new promising and growing research area Among other uses it provides efficient tools to deal with hard problems by evolving creative and competitive solutions Systems Programming is generally strewn with such hard problems This book is devoted to reporting innovative and significant progress about the contribution of genetic programming in systems programming The contributions of this book clearly demonstrate that genetic programming is very effective in solving hard and yet open problems in systems programming Followed by an introductory chapter in the remaining contributed chapters the reader can easily learn about systems where genetic programming can be applied successfully These include but are not limited to information security systems compilers data mining systems stock market prediction systems robots and automatic programming

Syntactic Networks—Kernel Memory Approach Tetsuya Hoya,2024-06-02 This book proposes a novel connectionist approach to a challenging topic of language modeling within the context of kernel memory and artificial mind system both proposed previously by the author in the very first volume of the series Artificial Mind System Kernel Memory Approach Studies in Computational Intelligence Vol 1 The present volume focuses on how syntactic structures of language are modeled in terms of the respective composite connectionist architectures each embracing both the nonsymbolic and symbolic parts These two parts are developed via inter module processes within the artificial mind system and eventually integrated under a unified framework of kernel memory The data representation by the networks embodied within the kernel memory principle is essentially local unlike conventional artificial neural network models such as the pervasive multilayer perceptron based neural networks With this locality principle kernel memory inherently bears many attractive features such as topologically unconstrained network formation straightforward network growing shrinking and reconfiguration no requirement of arduous iterative parameter tuning construction of transparent and hierarchical data structures and multimodal and temporal data processing via the network representation Exploiting these multifacet properties of kernel memory with interweaving the notion of inter module processing within the artificial mind system provides coherent accounts for concept formation and how various linguistic phenomena viz word compoundings morphologies and multiword constructions are modeled The description is then extended to more intricate network models of context dependent lexical network and syntactic oriented processing the latter being the central theme of the present study and further to those representing a hybrid of nonverbal and verbal thinking and semantic and pragmatic aspects of sentential meaning The book is intended for general readers engaging in various areas of study in cognitive science computer science engineering linguistics philosophy psycholinguistics and psychology
