**Doing without Concepts** Edouard Machery, 2009-02-27 Over recent years the psychology of concepts has been rejuvenated by new work on prototypes inventive ideas on causal cognition the development of neo empiricist theories of concepts and the inputs of the budding neuropsychology of concepts But our empirical knowledge about concepts has yet to be organized in a coherent framework In *Doing without Concepts* Edouard Machery argues that the dominant psychological theories of concepts fail to provide such a framework and that drastic conceptual changes are required to make sense of the research on concepts in psychology and neuropsychology Machery shows that the class of concepts divides into several distinct kinds that have little in common with one another and that for this very reason it is a mistake to attempt to encompass all known phenomena within a single theory of concepts In brief concepts are not a natural kind Machery concludes that the theoretical notion of concept should be eliminated from the theoretical apparatus of contemporary psychology and should be replaced with theoretical notions that are more appropriate for fulfilling psychologists goals The notion of concept has encouraged psychologists to believe that a single theory of concepts could be developed leading to useless theoretical controversies between the dominant paradigms of concepts Keeping this notion would slow down and maybe prevent the development of a more adequate classification and would overshadow the theoretical and empirical issues that are raised by this more adequate classification Anyone interested in cognitive science s emerging view of the mind will find Machery s provocative ideas of interest

**Merging Symbolic and Data-Driven AI for Robot Autonomy** Nikos Katzouris, Simona Perri, Mohan Sridharan, Daniele Meli, 2025-09-08 Robots are increasingly being deployed to assist and collaborate with humans in many applications such as medicine navigation and industrial automation To truly collaborate with humans in complex environments robots require advanced cognitive capabilities including the ability to reason with domain specific commonsense knowledge and the noise observations obtained in the presence of partial observability and non deterministic action outcomes Research in Artificial Intelligence AI has resulted in sophisticated symbolic formalisms that use temporal and logic relations to represent commonsense domain knowledge as well as probabilistic data driven frameworks that quantitatively represent uncertainty in the decision making process of robot systems Stand alone symbolic or stochastic AI methods have limitations when applied to robots in complex scenarios Symbolic AI methods reason with relational descriptions of the attributes of the domain and the robot to guide the robot's behavior It is however often computationally intractable to use these methods to reason about uncertainty quantitatively or to operate at the level of granularity required for precise interaction with objects in complex domains Probabilistic and data driven AI methods on the other hand elegantly represent uncertainty quantitatively and provide mechanisms for reasoning and acting at the level of granularity required for interaction with the physical worlds These methods however offer limited expressiveness for complex cognitive concepts *Proceedings of the 2011 Joint*
