Ultrafast Spectroscopy of Semiconductors and Semiconductor Nanostructures Jagdeep Shah, 2013-11-21 The field of ultrafast spectroscopy of semiconductors and their nanostructures continues to be an active field of research Exciting new developments have taken place since the first edition of this book was completed in 1995 This revised edition includes a discussion of many of these recent developments in the field This is accomplished by adding a chapter on Recent Developments at the end of the book This approach was selected to provide a discussion of results while they are still relatively recent Results published before the end of May 1998 were considered for inclusion in this book The objective of this revised edition remains the same as before to provide a cohesive discussion of the many diverse contributions of ultrafast spectroscopy to the field of semiconductors Extensive cross references are made to earlier chapters in order to accomplish this goal The chapter on Recent Developments begins with a brief discussion of new lasers new techniques of ultrafast spectroscopy and novel nanostructures This is followed by a section on Coherent Spectroscopy where some of the most interesting recent developments have taken place These include observation of quantum kinetic effects effects that require going beyond the mean field approach of the semiconductor Bloch equations coherent control of populations and current in semiconductors exciton continuum interactions and many diverse aspects of coherent spectroscopy including studies of microcavities Bragg structures quantum dots and quantum wires *Walford's Guide to Reference Material: Science and technology* Marilyn Mullan, Library Association, 1989 The Brit counterpart to Sheehy in which it is recommended The new edition places the author title subject indices in each volume Many entries cite reviews from other sources Rather tiresome recitation of selected chapter contents 6 000 entries with references in the annotations to one or two thousand further books Covers sci tech and paleontology anthro patents medicine trades and crafts Arranged by UDC classification Provides no prices Available in the US from American Library Assn Annotation copyrighted by Book News Inc Portland OR [Introduction to Materials Science](#) Jean P Mercier, Gerald Zambelli, Wilfried Kurz, 2012-12-02 The approach of this concise but comprehensive introduction covering all major classes of materials is right for not just materials science students and professionals but also for those in engineering physics and chemistry or other related disciplines The characteristics of all main classes of materials metals polymers and ceramics are explained with reference to real world

examples So each class of material is described then its properties are explained with illustrative examples from the leading edge of application This edition contains new material on nanomaterials and nanostructures and includes a study of degradation and corrosion and a presentation of the main organic composite materials Illustrative examples include carbon fibres the silicon crystal metallic glasses and diamond films Applications explored include ultra light aircraft contact lenses dental materials single crystal blades for gas turbines use of lasers in the automotive industry cables for cable cars permanent magnets and molecular electronic devices Covers latest materials including nanomaterials and nanostructures Real world case studies bring the theory to life and illustrate the latest in good design All major classes of materials are covered in this concise yet comprehensive volume

New Developments in Ferromagnetism Research V. N. Murray, 2005 Ferromagnetism is a form of magnetism that can be acquired in an external magnetic field and usually retained in its absence so that ferromagnetic materials are used to make permanent magnets A ferromagnetic material may therefore be said to have a high magnetic permeability and susceptibility which depends upon temperature Examples are iron cobalt nickel and their alloys Ultimately ferromagnetism is caused by spinning electrons in the atoms of the material which act as tiny weak magnets They align parallel to each other within small regions of the material to form domains or areas of stronger magnetism In an unmagnetised material the domains are aligned at random so there is no overall magnetic effect If a magnetic field is applied to that material the domains align to point in the same direction producing a strong overall magnetic effect Permanent magnetism arises if the domains remain aligned after the external field is removed Ferromagnetic materials exhibit hysteresis In 2004 it was discovered that a certain allotrope of carbon nanofoam exhibited ferromagnetism The effect dissipates after a few hours at room temperature but lasts longer at cold temperatures The material is also a semiconductor It is thought that other similarly formed materials of boron and nitrogen may also be ferromagnetic This new book rings together leading research from throughout the world

Introduction to the Physics of Electrons in Solids Henri Alloul, 2010-12-09 This textbook sets out to enable readers to understand fundamental aspects underlying quantum macroscopic phenomena in solids primarily through the modern experimental techniques and results The classic independent electrons approach for describing the electronic structure in terms of energy bands helps explain the occurrence of metals insulators and semiconductors It is underlined that superconductivity and magnetism can only be understood by taking into account the interactions between electrons The text recounts the experimental observations that have revealed the main properties of the superconductors and were essential to track its physical origin While fundamental concepts are underlined those which are required to describe the high technology applications present or future are emphasized as well Problem sets involve experimental approaches and tools which support a practical understanding of the materials and their behaviour
