Capillary Liquid Chromatography Boris Grigor'evich Belen'kiĭ, E.S. Gankina, Èmilii Savel'evna Gankina, 1987-03-31
In the early 1980s capillary liquid chromatography was being established it was a period in which only a few research groups published a relatively small number of papers on the subject Interest has since taken off and a period of intense development to which no end is yet in sight is now upon us More investigators and instrument making firms are now entering the field This greater interest has resulted in the rapid appearance of two collections 1 2 and a series of topical reviews 3 6 However it could hardly be said that all the problems in this area have been formulated let alone solved The preparation of very efficient open tubular or packed microbore columns for example remains more an art than a science while the relationship between radial and longitudinal mass transfer and the effect of transcolumn velocity profiles on chromatographic efficiency have been very poorly studied Indeed recent publications on these subjects have sometimes far from clarifying matters only muddied them further Many instrument making firms are trying to unify their equipment so that it is suitable for microbore conventional analytical and preparative liquid chromatography This approach has not realized the full potential of capillary chromatography and there also remains room for improving the performance of capillary columns
