A Classification of Demand Side Management Concepts. Their Potentials for a Renewable Energy System in Germany Lukas Schirren, 2023-04-12 Bachelor Thesis from the year 2022 in the subject Energy Sciences grade 1 3 Technical University of Berlin Wirtschafts und Infrastrukturpolitik language English abstract This paper will analyse Demand Side Management DSM an approach to include the demand side in the electricity system and consequently increase flexibility The demand side should be regarded as a variable and not as fixed as Gellings put it beautifully With renewable energy energy production becomes a variable source and the demand has to adapt accordingly The concept of DSM has been used in the USA since the 1980s but remains a novel subject in the European Union EU In 2009 the European Commission set the target to increase the capacities of DSM because only a tenth of the actual potential was used within the EU in 2014 A significant obstacle regarding DSM is the deviating estimation of DSM Potentials There exist multiple studies which estimate the potential in Germany but due to the high deviations that exist between them making it is difficult to estimate the real potential For investments this is an important measure and it should have high accuracy These deviations potentially come from a missing definition for DSM which is often entangled with Demand Response DR sector coupling and load management As no clear definition or distinction to other terms is visible it seems necessary to define the term DSM For that chapter 2 analyses the initial objective modern approach and relative terms of DSM Eventually this leads to a more precise distinction which helps to calculate the DSM potential from Germany with a broad analysis of multiple studies These studies are typically based on different assumptions and were conducted in different years therefore having different annual electricity consumption and consequently different potentials Ladwig 2018 A normalisation with regard to the annual electricity consumption will be performed and followed by a distinction of the assumed restrictions Here it helps to look at the DSM groups which can implement DSM measures and point out their individual restrictions and challenges that would limit their potential or increase the complexity of integration Scientific modelling helps to estimate the effects of novel approaches on the electricity system As DSM has many interdependencies and is very decentralised through many individual participants different approaches for a framework of DSM will be analysed

The Demand-side Management Program Development Process , 1992 This report describes an aspect of DSM that has received little attention namely how utilities

develop DSM programs The selection of utilities to study purposely was biased in favor of those with reputations for being experienced DSM program developers so as to optimize the chances to obtain detailed information The DSM planning process is affected by organizational factors and external influences 1 the location of the demand side planning department within the utility 2 the demand side planning group s functional responsibilities 3 upper management participation in the DSM program development process and 4 the organizational relationship between or separation of supply side and demand side planning Organizational factors reflect utilities views of DSM programs and thus can affect the adoption of a technology or customer oriented approach Despite repeated claims of the uniqueness of the demand side planning process and its resistance to standardization two general approaches to program development were discerned namely technology or customer orientation Although utilities consider customer related and technological factors in their DSM program development process utilities can be differentiated by their emphasis on one or the other approach 25 refs

Demand-Side Management and Integrated Resource Planning ,1991 Integrated resource planning differs from traditional utility planning practices primarily in its increased attention to demand side management DSM programs and its integration of supply and demand side resources into a combined resource portfolio This report details the findings from an Oak Ridge National Laboratory ORNL survey of 24 electric utilities that have well developed integrated planning processes These utilities account for roughly one third of total capacity electricity generation and DSM program expenditures nationwide The ORNL survey was designed to obtain descriptive data on a national sample of utilities and to test a number of hypothesized relationships between selected utility characteristics and the mix of resources selected for the integrated plan with an emphasis on the use of DSM resources and the processes by which they are chosen The survey solicited information on each utility s current and projected resource mix operating environment procedures used to screen potential DSM resources techniques used to obtain public input and to integrate supply and demand side options into a unified plan and procedures used in the final selection of resources for the plan
