Two The Deep:

Paleogeography and Sedimentary Development of Two Deep-marine Foreland Basins Anne Bernhardt, 2011 This dissertation comprises three chapters focusing on the evolution of marine sedimentary successions that formed as the fill of large submarine channel belts and their tributary systems. These channel belts serve as conduits for gravel and sand laden sediment gravity flows along the axes of narrow elongate foreland basins. In the past axial channel belts have not been widely recognized in submarine foreland basins. Mutti et al 2003. However recent studies have demonstrated the presence of axial channels 3-8 km in width and 100 km in length in a number of marine foredeeps including the Cretaceous Magallanes Basin southern Chile and the Tertiary Molasse Basin northern Austria. De Ruig and Hubbard 2006, Hubbard et al 2008, 2009. Additional studies have shown that similar channels are common in submarine trough shaped basins in other convergent margin settings such as the Peru Chile trench Thornburg et al 1990, V lker et al 2006, the Hikurangi trough offshore New Zealand Lewis and Pantin 2002 and the Nankai trough offshore Japan Fig 1 in Moore et al 2007 as well as in modern oceanic rift basins such as the Maury channel in the Northeast Atlantic Rockall Basin Cherkis et al 1973 and the Northwest Atlantic Mid Ocean Channel NAMOC in the Labrador Sea Hesse et al 1987, 1990, Hesse 1989, Klaucke et al 1998. These occurrences suggest that axial channels may be common sediment transport fairways in elongate deep water basins in a variety of tectonic settings. This thesis investigates the sedimentary evolution, stratigraphic architecture and paleogeography of such channel systems in two distinct yet analogous and complementary research areas: the Magallanes foreland basin in southern Chile and the Molasse foreland basin in northern Austria. The main objectives of this study are: a) to characterize the processes of submarine sediment transport and deposition in the study areas; b) to explain the associated filling patterns of ancient submarine axial channels and their tributaries; and c) to reconstruct the paleogeography of an ancient seafloor in order to better understand deep marine sediment dispersal patterns in narrow elongate basins. The Magallanes Basin is a retro arc foreland basin characterized by a deep marine filling history from the Cenomanian to the Turonian. Fildani et al 2003, Fosdick et al in press to the Campanian. Chapter 3: The numerous coarse grained submarine channel and lobe complexes of the Turonian to Campanian Cerro Toro Formation represent a large north-south oriented channel belt that funneled sediment gravity flows along the axis of the foreland basin parallel to the active thrust front. Hubbard et al 2008. This main axial trunk channel belt was probably fed by at least one and possibly numerous tributary channel systems coming off the Andean mountain front to the west. Similarly, sedimentation within the Upper Austrian Molasse Basin during the late Oligocene to early Miocene was largely controlled by an axial trunk channel that was fed by a deltaic system to the west and a tributary system lying along the Inntal fault zone to the southwest. De Ruig and Hubbard 2006. Three studies were undertaken in order to illuminate the processes and architecture of the fill of submarine foreland basin axial channels: the interaction of submarine debris flows and turbidity currents within the axial channel in the Molasse Basin. Chapter 1: the stratigraphic and architectural evolution

of coarse grained deep water deposits in a tributary system setting in the Magallanes Basin Chapter 2 and the paleogeography of the Magallanes Basin axial channel belt and its tributary system and the associated basin filling pattern over time Chapter 3 Multiple techniques were combined to achieve these goals including field mapping sedimentological analysis of outcrops and rock cores interpretation of wireline logs and 3D seismic reflection data U Pb dating of zircons strontium isotope stratigraphy and a novel approach to lithofacies proportion modeling Stright et al 2009

Performance Comparison of Two Deep Inducers as Separate Components and in Combination with an Impeller William K. Ritter, Ambrose Ginsburg, William L. Beede, 1945 Two deep inducers were tested as separate components and in combination with an impeller as a part of an investigation to correlated design requirements of inducers and impellers The inducers were designed to impart solid body or wheel rotation to the entering air at constant angular acceleration along the axial depth The axial depths were 3 00 inches and 2 12 inches The design load coefficients were 0 24 cubic foot per revolution for the 2 00 inch inducer and 0 35 cubic foot per revolution for the 2 12 inch inducer The impeller had straight radial blades and a ratio of discharge to inlet areas of 0 715 with uniform change of area along the passage The inlet diameters of the 24 blade impeller and inducers were 8 inches and the impeller diameter was 12 inches
