Relay-selection in Decode-and-forward Cooperative Systems Adham Hagag, University of Mississippi. Department of Electrical Engineering, University of Mississippi. School of Engineering, 2014 In the past few years adaptive decode and forward cooperative diversity systems have been studied intensively in literature Many schemes and protocols have been proposed to enhance the performance of the cooperative systems while trying to alleviate its drawbacks One of the recent schemes that had been shown to give high improvements in performance is the best relay selection scheme In the best relay selection scheme only one relaying nodes among the relays available in the system is selected to forward the source s message to the destination The best relay is selected as the relay node that can achieve the highest end to end signal to noise ratio SNR at the destination node Performance improvements have been reported as compared to regular fixed decode and forward relaying in which all relays are required to forward the source s message to the destination in terms of spectral efficiency and diversity order In this thesis we use simulations to show the improvement in the outage performance of the best relay selection scheme *Machine Learning and Intelligent Communications* Mingxiang Guan, Zhenyu Na, 2021-01-23
