Adaptive Signal Processing Thomas S. Alexander,2012-12-06 The creation of the text really began in 1976 with the author being involved with a group of researchers at Stanford University and the Naval Ocean Systems Center San Diego At that time adaptive techniques were more laboratory and mental curiosities than the accepted and pervasive categories of signal processing that they have become Over the last 10 years adaptive filters have become standard components in telephony data communications and signal detection and tracking systems Their use and consumer acceptance will undoubtedly only increase in the future The mathematical principles underlying adaptive signal processing were initially fascinating and were my first experience in seeing applied mathematics work for a paycheck Since that time the application of even more advanced mathematical techniques have kept the area of adaptive signal processing as exciting as those initial days The text seeks to be a bridge between the open literature in the professional journals which is usually quite concentrated concise and advanced and the graduate classroom and research environment where underlying principles are often more important *Advanced Concepts in Adaptive Signal Processing* W. Kenneth Jenkins,Andrew W. Hull,Jeffrey C. Strait,Bernard A. Schnaufer,Xiaohui Li,2012-12-06 Although adaptive filtering and adaptive array processing began with research and development efforts in the late 1950 s and early 1960 s it was not until the publication of the pioneering books by Honig and Messerschmitt in 1984 and Widrow and Stearns in 1985 that the field of adaptive signal processing began to emerge as a distinct discipline in its own right Since 1984 many new books have been published on adaptive signal processing which serve to define what we will refer to throughout this book as conventional adaptive signal processing These books deal primarily with basic architectures and algorithms for adaptive filtering and adaptive array processing with many of them emphasizing practical applications Most of the existing textbooks on adaptive signal processing focus on finite impulse response FIR filter structures that are trained with strategies based on steepest descent optimization or more precisely the least mean square LMS approximation to steepest descent While literally hundreds of archival research papers have been published that deal with more advanced adaptive filtering concepts none of the current books attempt to treat these advanced concepts in a unified framework The goal of this new book is to present a number of important but not so well known topics that currently exist scattered in the research literature The book also documents some new results that have been conceived and developed through research conducted at the University of Illinois during the past five years

Adaptive Signal Models Michael M. Goodwin, 2012-09-10 Adaptive Signal Models Theory Algorithms and Audio Applications presents methods for deriving mathematical models of natural signals The introduction covers the fundamentals of analysis synthesis systems and signal representations Some of the topics in the introduction include perfect and near perfect reconstruction the distinction between parametric and nonparametric methods the role of compaction in signal modeling basic and overcomplete signal expansions and time frequency resolution issues These topics arise throughout the book as do a number of other topics such as filter banks and multiresolution The second chapter gives a detailed development of the sinusoidal model as a parametric extension of the short time Fourier transform This leads to multiresolution sinusoidal modeling techniques in Chapter Three where wavelet like approaches are merged with the sinusoidal model to yield improved models In Chapter Four the analysis synthesis residual is considered for realistic synthesis the residual must be separately modeled after coherent components such as sinusoids are removed The residual modeling approach is based on psychoacoustically motivated nonuniform filter banks Chapter Five deals with pitch synchronous versions of both the wavelet and the Fourier transform these allow for compact models of pseudo periodic signals Chapter Six discusses recent algorithms for deriving signal representations based on time frequency atoms primarily the matching pursuit algorithm is reviewed and extended The signal models discussed in the book are compact adaptive parametric time frequency representations that are useful for analysis coding modification and synthesis of natural signals such as audio The models are all interpreted as methods for decomposing a signal in terms of fundamental time frequency atoms these interpretations as well as the adaptive and parametric natures of the models serve to link the various methods dealt with in the text Adaptive Signal Models Theory Algorithms and Audio Applications serves as an excellent reference for researchers of signal processing and may be used as a text for advanced courses on the topic

Adaptive Signal Processing in Wireless Communications Mohamed Ibnkahla, 2017-12-19 Adaptive techniques play a key role in modern wireless communication systems The concept of adaptation is emphasized in the Adaptation in Wireless Communications Series through a unified framework across all layers of the wireless protocol stack ranging from the physical layer to the application layer and from cellular systems to next generation wireless networks This specific volume Adaptive Signal Processing in Wireless Communications is devoted to adaptation in the physical layer It gives an in depth survey of adaptive signal processing techniques used in current and future generations of wireless communication systems Featuring the work of leading international experts it covers adaptive channel modeling identification and equalization adaptive modulation and coding adaptive multiple input multiple output MIMO systems and cooperative diversity It also addresses other important

R. Diniz,2008-05-22 The field of Digital Signal Processing has developed so fast in the last three decades that it can be found in the graduate and undergraduate programs of most universities This development is related to the increasingly available technologies for implementing digital signal processing algorithms The

tremendous growth of development in the digital signal processing area has turned some of its specialized areas into fields themselves. If accurate information of the signals to be processed is available, the designer can easily choose the most appropriate algorithm to process the signal. When dealing with signals whose statistical properties are unknown, fixed algorithms do not process these signals efficiently. The solution is to use an adaptive filter that automatically changes its characteristics by optimizing the internal parameters. Adaptive filtering algorithms are essential in many statistical signal processing applications. Although the field of adaptive signal processing has been subject of research for over four decades, it was in the eighties that a major growth occurred in research and applications. Two main reasons can be credited to this growth: the availability of implementation tools and the appearance of early textbooks exposing the subject in an organized manner. Still today it is possible to observe many research developments in the area of adaptive filtering, particularly addressing specific applications.

Adaptive Signal Processing Bernard Widrow, 1985

Adaptive Signal Processing, 1991

A Novel Approach for Adaptive Signal Processing Ya-Chin Chen, Institute for Computer Applications in Science and Engineering, 1998

Abstract: Adaptive linear predictors have been used extensively in practice in a wide variety of forms. In the main, their theoretical development is based upon the assumption of stationarity of the signals involved, particularly with respect to the second order statistics. On this basis, the well known normal equations can be formulated. If high order statistical stationarity is assumed, then the equivalent normal equations involve high order signal moments. In either case, the cross moments second or higher are needed. This renders the adaptive prediction procedure non-blind. A novel procedure for blind adaptive prediction has been proposed, and considerable implementation has been made in our contributions in the past year. The approach is based upon a suitable interpretation of blind equalization methods that satisfy the constant modulus property and offers significant deviations from the standard prediction methods. These blind adaptive algorithms are derived by formulating Lagrange equivalents from mechanisms of constrained optimization. In this report, other new update algorithms are derived from the fundamental concepts of advanced system identification to carry out the proposed blind adaptive prediction. The results of the work can be extended to a number of control related problems such as disturbance identification. The basic principles are outlined in this report, and differences from other existing methods are discussed. The applications implemented are speech processing such as coding and synthesis. Simulations are included to verify the novel modelling method.
