Combustion Generated Air Pollution:

Combustion-Generated Air Pollution Ernest Starkman, 2012-12-06 This collection of notes was assembled as a supplement and guide to a five day short course presented at the University of California at Berkeley September 22-26 1969 The scope of subject matter while limited to combustion as a source of air pollution at the same time is intended to give the broadest possible exposure within that area The spectrum is deliberately wide ranging from fundamentals of combustion and combustion reactions through performance of combustion systems and to legal and administrative control Contributors to this compendium and lecturers in the subject were solicited from academic and public organizations Most of the authors are from the statewide University of California and the California Department of Public Health Notable individuals with particular expertise from other institutions were also invited to contribute The choice of instructor in each case was based upon a desire to collect a cross section of outstanding individuals each highly qualified technically in his field These notes reflect the freedom which each author was encouraged to follow in providing supplementary material for his lecture The staff of Continuing Education in Engineering Professor Thomas Hazlett and Daphne Stern deserve commendation for their effective and successful handling of the innumerable details which were encountered Professors Robert Sawyer and Laurence Caretto are herewith gratefully acknowledged for their support in the seemingly uncountable tasks necessary to assemble the entity which is represented

Combustion-generated Indoor Air Pollution, 1978 The indoor air quality of residential buildings was characterized to determine the types rates of emissions and fates of gaseous and particulate air pollutants from typical indoor combustion appliances Measurements were conducted in occupied residential buildings and during controlled laboratory experiments with combustion appliances The SO₂ NO NO₂ O₃ CO and CO₂ concentrations and aerosol size distribution were determined on a continuous basis Total and respirable fraction particulate samples were collected on membrane filter media for analysis by x ray fluorescence XRFA photoelectron spectroscopy ESCA proton activation analysis PAA combustion and wet chemistry techniques for the determination of particulate elemental composition S N C etc and ionic species such as SO₄²⁻ NO₃ and NH₄ Results of the study indicate that the concentrations of some gaseous and respirable particulate air pollutants in the indoor environment exceed those levels commonly found in the outdoor urban air environment Such findings may have a large impact on the future design of epidemiology studies on energy conservation strategies for buildings and on the need for more stringent control of air pollution from indoor combustion sources
