**LES of Combustion Dynamics in a Pulse Combustor** K. Tajiri, 2001 *Recurrence Plots and Their Quantifications: Expanding Horizons* Charles L. Webber, Jr., Cornel Ioana, Norbert Marwan, 2016-05-18 The chapters in this book originate from the research work and contributions presented at the Sixth International Symposium on Recurrence Plots held in Grenoble France in June 2015 Scientists from numerous disciplines gathered to exchange knowledge on recent applications and developments in recurrence plots and recurrence quantification analysis This meeting was remarkable because of the obvious expansion of recurrence strategies theory and applications practice into ever broadening fields of science It discusses real world systems from various fields including mathematics strange attractors applied physics physiology medicine environmental and earth sciences as well as psychology and linguistics Even readers not actively researching any of these particular systems will benefit from discovering how other scientists are finding practical non linear solutions to specific problems The book is of interest to an interdisciplinary audience of recurrence plot users and researchers interested in time series analysis in particular and in complex systems in general

**Understanding and Control of Combustion Dynamics in Gas Combustors** Ben Zinn, Georgia Institute of Technology. School of Aerospace Engineering. Project no. E-16-U69, 2004 **Emissions, Combustion Dynamics, and Control of a Multiple Swirl Combustor**, 2004 To achieve single digit NOx emission from gas turbine combustors and prevent the combustion dynamics encountered in Lean Premixed Combustion it is essential to understand the correlations among emission characteristics combustion dynamics and dynamics and characteristics of swirling flow field The focus of this dissertation is to investigate the emission characteristics and combustion dynamics of multiple swirl dump combustors either in premixing or non premixed combustion e g Lean Direct Injection and correlate these combustion characteristics emissions combustion instability and lean flammability to the fluids dynamics flow structures and its evolution This study covers measurement of velocity flow field temperature field and combustion under effects of various parameters including inlet flow Reynolds number inlet air temperature swirl configurations downstream exhaust nozzle contraction ratios length of mixing tube These parameters are tested in both liquid and gaseous fuel combustions Knowledge obtained through this comprehensive study is applied to passive and active

controls for improving gas turbine combustion performance in the aid of novel sensor and actuator technologies Emissions and combustion characteristics are shown closely related to the shape and size of central recirculation zone CRZ the mean and turbulence velocity and strain rate and dynamics of large vortical structures The passive controls mostly geometry factors affect the combustion characteristics and emissions through their influences on flow fields and consequently temperature and radical fields Air assist which is used to adjust the momentum of fuel spray is effective in reducing NOx and depress combustion oscillation without hurting LBO Fuel distribution split is also one important factor for achieving low NOx emission and control of combustion dynamics The dynamics of combustion including flame oscillations close to LBO and acoustic combustion instability can be characterized by OH CH radical oscillations and phase locked chemiluminescence imaging The periodic fluctuation of jet velocity and formation of large vortical structures within CRZ are responsible for combustion instability in multiple swirl combustors

*Transient Combustion Dynamics* P. R. Choudhury, Melvin Gerstein, Reza Mojaradi, UNIVERSITY OF SOUTHERN CALIFORNIA LOS ANGELES., UNIVERSITY OF SOUTHERN CALIFORNIA LOS ANGELES DEPT OF MECHANICAL ENGINEERING., 1984 Characteristics of pressure fluctuations due to the instability of the shear layer at the sudden expansion step of a dump combustor are being studied experimentally Results show that the disturbances induced by the step are centered around a characteristic frequency which is a function of the shape of the chamber The center frequency appear to be independent of either the step height of the free stream velocity within the range of the experimental variables The step height and the free stream velocity affect only the amplitude and not the frequency of the disturbance Closely spaced frequencies around the center frequency lead to a low frequency beating phenomenon which is clearly seen on a oscilloscope Axisymmetric and two dimensional chambers have different characteristic center frequencies and beat frequency distributions This coherent beating appears to be responsible for the low frequency combustion instability in dump combustors Work is continuing in order to understand the nature of the coherent beating and its influence on the combustor A feedback control is to be used to destroy the coherence of the critical beating and minimize the effect of combustion instability

*Combustion Dynamics and Fluid Mechanics in Acoustically Perturbed Non-premixed Swirl-stabilized Flames* Uyi O. Idahosa, 2010 The prevalence of gas turbines operating in primarily lean premixed modes is predicated on the need for lower emissions and increased efficiency An enhancement in the mixing process through the introduction of swirl in the combustion reactants is also necessary for flame stabilization The resulting lean swirling flames are often characterized by a susceptibility to feedback between velocity pressure and heat release perturbations with a potential for unstable self amplifying dynamics The existing literature on combustion dynamics is predominantly dedicated to premixed flame configurations motivated by power

generation and propulsive gas turbine applications In the present research effort an investigation into the response of atmospheric non premixed swirling flames to acoustic perturbations at various frequencies  $f$  subscript p 0 315Hz and swirl intensities  $S$  0 09 and  $S$  0 34 is carried out The primary objective of the research effort is to broaden the scope of fundamental understanding in flame dynamics in the literature to include non premixed swirling flames Applications of the research effort include control strategies to mitigate the occurrence of combustion instabilities in future power generation gas turbines Flame heat release is quantitatively measured using a photomultiplier with a 430nm bandpass filter for observing CH chemiluminescence which is simultaneously imaged with a phase locked CCD camera Acoustic perturbations are generated with a loudspeaker at the base of an atmospheric co flow burner with resulting velocity oscillation amplitudes vertical line u U subscript avg vertical line in the 0 03 0 30 range The dependence of flame dynamics on the relative richness of the flame is investigated by studying various constant fuel flow rate flame configurations The effect of varying fuel flow rates on the flame response is also examined using with dynamic time dependent fuel supply rates over the data acquisition period The Particle Image Velocimetry PIV method is used to study the isothermal flow field associated with acoustic pulsing The acoustic impedance wavelet analysis Rayleigh criteria and phase conditioning methods are used to identify fundamental mechanisms common to highly responsive flame configurations
