

... are being taken from 4 to 10 amperes according to the size and style.
It is unfortunate that we have no name for the unit flow of water, which means one gallon per second. Consequently we always have to say five gallons per second, ten gallons per second, etc.

Similarly, we never ask, "How much electricity is there in that wire?" but rather, "How much current is flowing along that wire?" By which question we mean, "How much electricity flows along that wire per second?" The answer could not be "Five coulombs," but it might be "Five coulombs per second." We are interested not in the quantity, but in the quantity that passes in a second.

Now a coulomb of electricity is just as definite a quantity of electricity as a gallon is a definite quantity of water, the unit being the same given to the unit in which quantity of electricity is measured.

But we are fortunate in not having to use the term "coulomb per second" to denote quantity of electricity that flows per second. We call this "ampere per second" as amperes. Instead, therefore, of answering the above question by, "Five coulombs per second," we would say, "Five amperes." Thus we do not need to say "per second" each time, as "amperes" means "coulombs per second." As ten amperes means ten coulombs per second, etc.

Since we are always concerned with the flow of electricity and not the quantity, we employ continually the term amperes and rarely use the term coulomb.

1. (b) Pressure (that which causes a current to flow), Volt.

When a current of water flows through a pipe, we know that it flows because there is water pressure exerted on it, which causes it to flow. We say that in certain parts of the town the water comes to the houses under a pressure of 30 lbs. per sq. in. If one happens to live near the reservoir or pumping station, the pressure is likely to be higher than that at some distant point.

Similarly, when an electric current flows along a conductor, we know that it is caused to flow by some electric pressure. If we live near the generating station the pressure is likely to be higher than if we live at some distance. Thus the current through an incandescent lamp is made to flow by maintaining a pressure across the lamp. Ordinarily this is about 110 volts. When the lamp is turned on, it simply means that this pressure is allowed to act and force the $\frac{1}{2}$ ampere of current through the carbon filament of the lamp. Just as turning on the valve allows the 30 lbs. per sq. in. pressure to act and to force $\frac{1}{2}$ gallon per second through a water pipe. The 110 volts electric pressure does exactly the same thing to the electric current that the 30 lbs. per sq. in. water pressure does to the current

Multi-terminal Direct-Current Grids Nilanjan Chaudhuri, Balarko Chaudhuri, Rajat Majumder, Amirnaser Yazdani, 2014-09-09 A generic DC grid model that is compatible with the standard AC system stability model is presented and used to analyse the interaction between the DC grid and the host AC systems A multi terminal DC MTDC grid interconnecting multiple AC systems and offshore energy sources e.g wind farms across the nations and continents would allow effective sharing of intermittent renewable resources and open market operation for secure and cost effective supply of electricity However such DC grids are unprecedented with no operational experience Despite lots of discussions and specific visions for setting up such MTDC grids particularly in Europe none has yet been realized in practice due to two major technical barriers Lack of proper understanding about the interaction between a MTDC grid and the surrounding AC systems Commercial unavailability of efficient DC side fault current interruption technology for conventional voltage sourced converter systems This book addresses the first issue in details by presenting a comprehensive modeling analysis and control design framework Possible methodologies for autonomous power sharing and exchange of frequency support across a MTDC grid and their impact on overall stability is covered An overview of the state of the art challenges and on going research and development initiatives for DC side fault current interruption is also presented
