Directions In Mathematical Quasicrystals:

Directions in Mathematical Quasicrystals Michael Baake,2000 This volume includes twelve solicited articles which survey the current state of knowledge and some of the open questions on the mathematics of aperiodic order A number of the articles deal with the sophisticated mathematical ideas that are being developed from physical motivations Many prominent mathematical aspects of the subject are presented including the geometry of aperiodic point sets and their diffractive properties self affine tilings the role of C algebras in tiling theory and the interconnections between symmetry and aperiodic point sets Also discussed are the question of pure point diffraction of general model sets the arithmetic of shelling icosahedral quasicrystals and the study of self similar measures on model sets From the physical perspective articles reflect approaches to the mathematics of quasicrystal growth and the Wulff shape recent results on the spectral nature of aperiodic Schrödinger operators with implications to transport theory the characterization of spectra through gap labelling and the mathematics of planar dimer models A selective bibliography with comments is also provided to assist the reader in getting an overview of the field The book will serve as a comprehensive guide and an inspiration to those interested in learning more about this intriguing subject

Substitution and Tiling Dynamics: Introduction to Self-inducing Structures Shigeki Akiyama,Pierre Arnoux,2020-12-05 This book presents a panorama of recent developments in the theory of tilings and related dynamical systems It contains an expanded version of courses given in 2017 at the research school associated with the Jean Morlet chair program Tilings have been designed used and studied for centuries in various contexts This field grew significantly after the discovery of aperiodic self similar tilings in the 60s linked to the proof of the undecidability of the Domino problem and was driven further by Dan Shechtman's discovery of quasicrystals in 1984 Tiling problems establish a bridge between the mutually influential fields of geometry dynamical systems aperiodic order computer science number theory algebra and logic The main properties of tiling dynamical systems are covered with expositions on recent results in self similarity and its generalizations fusions rules and S adic systems algebraic developments connected to physics games and undecidability questions and the spectrum of substitution tilings

From Riemann to Differential Geometry and Relativity Lizhen Ji,Athanasios Papadopoulos,Sumio Yamada,2017-10-03 This book explores the work of Bernhard Riemann and its impact on mathematics philosophy and physics It features contributions from a range of fields historical expositions and selected research articles that were motivated by Riemann's ideas and demonstrate their timelessness The editors are convinced of the tremendous value of going into Riemann's work in depth investigating his original ideas integrating them into a broader perspective and establishing ties with modern science and philosophy Accordingly the contributors to this volume are mathematicians physicists philosophers and historians of science The book offers a unique resource for students and researchers in the fields of mathematics physics and philosophy historians of science and more generally to a wide range of readers interested in the history of ideas

Silicon Versus Carbon Yuri Magarshak,Sergey Kozyrev,Ashok K.

Vaseashta,2009-05-21 Even though there is no generally accepted definition of nanotechnologies to be defined as distinct discipline there is an emerging consensus that their advent and development is a growing in importance factor of the contemporary and future technological civilization One of these most fundamental issues we are confronted with is the compatibility with life itself From single cell organisms to humans carbon is a key building block of all molecular structures of life In contrast the man created electronic industry to build on other elements of which silicon is the most common Both carbon and silicon create molecular chains although different in their internal structure All life is built from carbon based chains As long as the man built technological products do not directly interfere with the physiology of life the associated risks from them are relatively easy to identify They are primarily in the environmental pollution and the possibility of upsetting the natural balance of biocoenosis on a planetary scale The basic life functions are still not directly subverted We can use TV computers drive cars and use other technological utilities without fear of direct interference with our cellular functions This is in particular because all these technological utilities are many orders of magnitude larger than typical scales of biological activity Most of biological activity from fermentative catalysis to DNA replication takes place on nanoscale The situation is radically different when the technological goals are building nanoscale size products All biological processes take place on nanoscale
