Statistical Methods in Quantum Optics 2 Non Classical Fields continues the development of the methods used in quantum optics to treat open quantum systems and their fluctuations Its early chapters build upon the phase space methods introduced in the first volume Statistical Methods in Quantum Optics 1 Matter Equations and Fokker Planck Equations the difficulties these methods face in treating non classical light are exposed where the regime of large fluctuations failure of the system size expansion is shown to be particularly problematic Cavity QED is adopted as a natural vehicle for extending quantum noise theory into this regime In response to the issues raised the theory of quantum trajectories is presented as a universal approach to the treatment of fluctuations in open quantum systems This book presents its material at a level suitable for beginning researchers or students in an advanced course in quantum optics or a course in quantum mechanics or statistical physics that deals with open quantum systems The text is complemented by exercises and interspersed notes that point the reader to side issues or a deeper exploration of the material presented **The Quantum World of Ultra-Cold Atoms and Light Book II: The Physics of Quantum-Optical Devices** Crispin Gardiner,Peter Zoller,2015-04-24 This century has seen the development of technologies for manipulating and controlling matter and light at the level of individual photons and atoms a realm in which physics is fully quantum mechanical The dominant experimental technology is the laser and the theoretical paradigm is quantum optics The Quantum World of Ultra Cold Atoms and Light is a trilogy which presents the quantum optics way of thinking and its applications to quantum devices This book The Physics of Quantum Optical Devices provides a comprehensive treatment of theoretical quantum optics It covers applications to the optical manipulation of the quantum states of atoms laser cooling continuous measurement quantum computers and quantum processors superconducting systems and quantum networks The subject is consistently formulated in terms of quantum stochastic techniques and a systematic and thorough development of these techniques is a central part of the book There is also a compact overview of the ideas of quantum information theory The main aim of the book is to present the theoretical techniques necessary for the understanding of quantum optical devices with special attention to those devices used in quantum information processing and quantum simulation Although these techniques were developed originally for the optical regime they are also applicable to electromagnetic radiation from the microwave realm to the ultra violet and for atomic systems Josephson junction systems quantum dots and nano mechanical systems For more information please visit <http>
