Generation and Effector Functions of Regulatory Lymphocytes Gregory R. Bock, Jamie A. Goode, 2003-11-07 Over the last several years immunologists have re discovered the importance of regulatory lymphocytes formerly termed suppressor cells Many recent reports have documented their existence effector functions and potential therapeutic benefits in autoimmunity and transplantation However even though modern techniques have allowed us

to get a much more detailed picture of these cells they are still highly controversial Several unresolved issues responsible for this dilemma are discussed in this book it is difficult to grow and clone such cells their phenotypes and effector functions are diverse and can sometimes easily be lost and it is not well understood how they interact with antigen presenting cells This book contains contributions from leading investigators from around the world including lively discussion of the current state of the art in studies of regulatory lymphocytes Topics featured are the physiological control of autoimmunity the role of antigen specific cells in various diseases and disease models and effector mechanisms Therapeutic applications are considered particularly for type 1 diabetes tissue transplantation and the control of viral infection This important and groundbreaking book should be of interest to all immunologists Related Novartis Foundation symposia 254

Jingwu Zhang,2007-01-25 This book critically reviews both clinical and immunological aspects of autoimmune disease with a strong emphasis on multiple sclerosis MS Research in MS is one of the fastest developing areas in modern medicine It employs some of the newest concepts in autoimmune mechanisms and an array of new treatments that would have been considered science fiction only two decades ago It is an area in which research findings are being actively translated into treatment strategies Advances in this area have both clinical and scientific implications for other autoimmune conditions that share many similarities with MS The book which comprises 24 chapters contributed by experts and thought leaders in the field is designed to provide new insights into two arenas our current understanding of autoimmune mechanisms and immune regulation and the latest developments in immunotherapy This book is intended for both researchers and clinicians Its purpose is not only to provide a comprehensive review on the recent advances in the two arenas mentioned above but also to reflect the current opinions or concepts that influence our thinking about the disease mechanisms and our way of treating MS patients Many of these issues have emerged from recent studies and are somewhat contradictory to traditional thinking For example recent studies have indicated that MS is more heterogeneous in many aspects than traditionally thought Pathologically in addition to demyelination and inflammation there is axonal loss or damage detectable in the central nervous system CNS lesions *Linking Environmental Agents to Autoimmune Diseases* ,1999 **Autoimmune Diseases and Treatment**
