GENERAL DESCRIPTION

The brakes used (fig. 1) on both front and rear of all models are the Duo-Servo single anchor type which utilizes the momentum of the vehicle to assist in the brake application. This self-energizing or self-actuating force is applied to both brake shoes at each wheel in both forward or reverse motion.

Wheel cylinders (fig. 2) are the double piston type providing even distribution of pressure to each brake shoe. To keep out dirt and moisture and to prevent pumping of the brake fluid, both ends of each wheel

cylinder are sealed with a rubber boot. The wheel cylinders have no external adjustments.

The main cylinder (fig. 3) consists of a piston which receives mechanical pressure from the push rod and exerts pressure on the fluid in the lines, building up the hydraulic pressure, which moves the wheel cylinder pistons.

The passenger car parking brake pedal (fig. 4) is located to the left of the steering column. A cable type linkage, directed over two pulleys, converts this pedal
