Diophantine Frobenius Problem:

The Diophantine Frobenius Problem Jorge L. Ramírez Alfonsín, 2005-12-01 During the early part of the last century Ferdinand Georg Frobenius 1849 1917 raised the following problem known as the Frobenius Problem FP given relatively prime positive integers a_1 find the largest natural number called the Frobenius number and denoted by $g(a_1)$ that is not representable as a nonnegative integer combination of a_1 At first glance FP may look deceptively specialized Nevertheless it crops up again and again in the most unexpected places and has been extremely useful in investigating many different problems A number of methods from several areas of mathematics have been used in the hope of finding a formula giving the Frobenius number and algorithms to calculate it The main intention of this book is to highlight such methods ideas viewpoints and applications to a broader audience

Algorithms and Discrete Applied Mathematics
 Subrahmanyam Kalyanasundaram, Anil Maheshwari, 2024-01-13 This book constitutes the refereed proceedings of the 10th International Conference on Algorithms and Discrete Applied Mathematics CALDAM 2024 held in Bhubaneswar India during February 15-17, 2024. The 22 full papers included in this book were carefully reviewed and selected from 57 submissions. They were organized in topical sections as follows: Algorithms and Complexity, Computational Geometry, Discrete Applied Mathematics, Graph Algorithms, Graph Theory. *A Panorama of Singularities* Francisco-Jesús Castro-Jiménez, David Bradley Massey, Bernard Teissier, Meral Tosun, 2020-01-13 This volume contains the proceedings of the conference A Panorama on Singular Varieties celebrating the 70th birthday of Lê Dũng Tráng held from February 7-10, 2017 at the University of Seville, IMUS, Seville, Spain. The articles cover a wide range of topics in the study of singularities and should be of great value to graduate students and research faculty who have a basic background in the theory of singularities. Numerical Semigroups and Applications Abdallah Assi, Pedro A. García-Sánchez, 2016-08-25 This work presents applications of numerical semigroups in Algebraic Geometry, Number Theory, and Coding Theory. Background on numerical semigroups is presented in the first two chapters which introduce basic notation and fundamental concepts and irreducible numerical semigroups. The focus is in particular on free semigroups which are irreducible semigroups associated with planar curves and of this kind. The authors also introduce semigroups associated with irreducible meromorphic series and show how these are used in order to present the properties of planar curves. Invariants of non-unique factorizations for numerical semigroups are also studied. These invariants are computationally accessible in this setting and thus this monograph can be used as an introduction to Factorization Theory. Since factorizations and divisibility are strongly connected, the authors show some applications to AG Codes in the final section. The book will be of value for undergraduate students, especially those at a higher level, and also for researchers wishing to focus on the state of art in numerical semigroups research.

Resources for Teaching Discrete Mathematics Brian Hopkins, 2009 Hopkins collects the work of 35 instructors who share their innovations and insights about teaching discrete mathematics at the high school and college level. The book's 9 classroom-tested projects, including building a geodesic dome, come with student handouts, solutions, and notes for the instructor. The 11 history modules presented draw on original sources such as Pascal's Treatise on the Arithmetical Triangle, allowing students to explore topics in their original contexts. Three articles address extensions of standard discrete mathematics content. Two other articles explore pedagogy specifically related to discrete mathematics courses, adapting a group discovery method to larger classes and using logic in encouraging students to construct proofs.

Extending the Linear Diophantine Problem Curtis Kifer, 2011-09 Given integer-valued relatively prime coins a_1, a_2, \dots, a_k , the Frobenius number is the largest integer n such that the linear Diophantine equation $a_1 m_1 + a_2 m_2 + \dots + a_k m_k = n$ has no solution in non-negative integers m_1, m_2, \dots, m_k . We denote by $g(a_1, \dots, a_k)$ the largest integer value not attainable by this coin system. That is to say that any integer x greater than the Frobenius

number g $a_1 \dots a_k$ has a representation $x_1 a_1 + x_2 a_2 + \dots + x_k a_k$ by $a_1 \dots a_k$ for some non negative integers $x_1 \dots x_k$ We say x is representable by $a_1 \dots a_k$ While it is obvious that there are representable positive integers and non representable positive integers must there be a largest non representable integer Maybe there are indefinitely large non representable integers for $a_1 \dots a_k$ with $\gcd(a_1, a_2, \dots, a_k) = 1$ This notion of whether or not the Frobenius number is well defined will be the first bit of mathematics we look at in this paper Proposition 1.1 The Frobenius number $g(a_1, \dots, a_k)$ is well defined Proof Given a_1, a_2, \dots, a_k with $\gcd(a_1, a_2, \dots, a_k) = 1$ the extended Euclidean algorithm gives that there exist $m_1, m_2, \dots, m_k \in \mathbb{Z}$ such that
