

Origin of the Earth

The Earth probably formed from material in the solar nebula—the cloud of gas and dust that led to the formation of the Sun. This material gradually grew into a larger and larger body that became a red-hot ball of rock and metal. Later the rocky crust formed, its surface cooling enough to allow the continents to appear. Even later the oceans arrived, as well as the tiny organisms that released oxygen into the atmosphere. Although much of this gas was initially consumed in chemical reactions, over time, it allowed the development of multicellular organisms and an explosion of life that took place at the start of the Paleozoic Era, 542 million years ago.

Continental Drift

Over time the continents, which are part of tectonic plates that drift across the Earth's surface at the rate of a few centimeters per year, have shifted and separated into parts of the world we know today. When tectonic plates are pushed together, they can create new mountain ranges. When the plates separate, a rift forms. The rift eventually fills with water, forming the ocean. The rift eventually fills with the salt-laden water from the other plates, creating a new ocean basin. The rift eventually fills with the salt-laden water from the other plates, creating a new ocean basin. Origin of the Earth

The Earth was formed 4.5 billion years ago from a cloud of dust and gas. In the beginning, it was a molten, glowing ball of fire. Over time, the Earth cooled and the atmosphere began to form. The atmosphere was made of gases that were released from the Earth's interior.
