## DYNAMICS OF MACHINES WITH VARIABLE MASS

by L. Cvjetković

Publisher: Gordon and Breach Science Publishers, 1998

UDC 62-133.4+62-253(045)

This book is designed to be a complete and integrated text on the dynamic properties of machines, mechanisms and rotors with variable mass. New results are presented from investigations based on the general dynamics of systems with variable parameters. The book considers both weak and strong nonlinear vibrations of these systems and chaotic phenomena are also discussed. The conservation laws and adiabatic invariants for systems with variable mass are formulated and the stability and instability conditions of motion are defined.

The book contains seven chapters for which brief description are given below.

Chapter 1 describes various machines and rotors with time variable mass and parameters such as centrifuges, sieves for sorting particles, transportation mechanisms, lifting mechanisms, cranes, automatic weight measuring instruments, and rotors used in the textile, cable and paper industries.

Chapter 2 introduces modelling of machines with variable mass. The classical laws of mechanics for constant mass are transformed for systems with variable mass. The theory of rigid body is specially treated. The Lagrange procedure for forming differential equations of motion for systems with variable mass is developed.

Chapter 3 and 4 consider the oscillations of machines with variable mass. Nonlinear oscillations of systems with time variable parameters are denoted analytically and composed with numerical results. Systems considered are not only those with small nonlinearity but also those with strong nonlinearity. Differential equations with a complex deflection function are examined, as they describe the motion of the majority of rotors with variable mass. The methods adopted for solving such equations are the Bogolubov-Mitropolski method, the elliptic-Krylov-Bogolubov method, the method of slow variable amplitude and phase, and the method of multiple scales. The influence of reactive force on the motion of the machine is investigated. It can be seen that reactive force has a fundamental influence on dynamic behavior of rotors and mechanisms with variable mass. Therefore, it cannot be neglected.

Chapter 5 treats the problem of chaos in nonlinear systems with variable mass. The analytical Melnikov criteria are extended for such systems. Two examples of real machines are considered: chaos in the crane mechanism and chaos in the separator.

Chapter 6 is about the formulation of conservation laws and adiabatic invariants for systems with variable mass. The first integrals are obtained using the theory of Emmy Noether. Examples of a rotor with variable mass and of a sieve for separating particles are also discussed. The adiabatic invariants for systems with one- and two-degrees-of-freedom for different types of nonlinearity are also considered. The adiabatic invariants

consists of producing the schematic or block diagram of the system based on nothing more than a given set of specifications The design serves as the basis for the construction of the actual hardware system In the new Third Edition Comer introduces state machines earlier than in previous editions and adds entire chapters on programmable logic devices and computer organization
