

# The Verification of Compliance with Arms-Control Agreements

*Military activities in the U.S.S.R. can be unilaterally monitored by the U.S. with the aid of a wide spectrum of remote-sensing technologies, including high-resolution satellite photography*

by David Hafemeister, Joseph J. Romm and Kostis Tsipis

The recent decision by the U.S. and the U.S.S.R. to resume bilateral arms-control negotiations was heralded by both governments with public statements emphasizing the need to halt and even reverse the growth of their nuclear arsenals and related weapon systems. Given the present climate of mistrust between the two nations, it is repetitive that compliance with the terms of any treaty that might emerge from the new negotiations be unilaterally verifiable by each side. Verification requires that each nation have a reliable and objective means of monitoring the military activities of the other. Accordingly, both nations have over the years developed a completely new family of systems for gathering such information from a distance. The systems are collectively referred to as national technical means of verification.

The issue of verification is quite separate not only from the legal question of whether an observed activity constitutes a treaty violation, but also from the political question of what to do about a violation once it has been detected. Nevertheless, verification is more than just a technical issue. In the U.S., for instance, verification has been a focal point of the recurrent political debate over the merits of various existing and proposed arms-control treaties. Opponents of any particular treaty tend to argue that the U.S. cannot verify Soviet compliance well enough to maintain national security under the terms of the treaty, whereas advo-

cates of the treaty tend to argue that the U.S. can.

In general, the question of whether or not a treaty is verifiable by the U.S. can be reduced to two narrower questions: First, at what level of clandestine Soviet activity would U.S. security be jeopardized? Second, is the U.S. system of verification capable of detecting that level of activity?

What are the technologies needed to observe the development, testing, production and deployment of a weapon system? The earliest detectable signs of development might be communications between officials and scientists working on the weapon; some of these signals could be intercepted by monitoring radio waves. Alternatively, a spy might observe the weapon or its plans directly. According to a statement made in 1979 by William J. Perry, then Undersecretary of Defense for Research and Engineering, "we monitor the activity at the [Soviet missile] design bureaus well enough that we have been able to predict every major [intercontinental ballistic missile] before it ever began its test.... We have always in the past been able to detect an error's existence before it ever went into test."

Once a weapon arrives at the stage of testing outside the laboratory, the full spectrum of acoustic and electromagnetic energy can be exploited to gain information about it. Visible-light detectors such as those on photoscanning satellites can "see" the weap-

on directly; infrared detectors on satellites can sense the heat emitted by a rocket exhaust plume during tests; microwave track a weapon in the air; sonar can track one in the water, and telescopes can detect and assess an underground nuclear test.

After a weapon has been fully tested it moves into production. Production involves large-scale transportation to and from manufacturing plants, an activity that can be monitored with the aid of visible light or infrared radiation. Finally, the operational deployment and training of personnel with the new weapon can also be monitored. The main difference in observing these processes is that in general testing and production can be detected while they are happening, whereas deployment involves activities that continue for years and can be detected at any time after they begin.

Determining whether the U.S.S.R. is violating the terms of a treaty, however, does not require observing every thing having to do with the laborious process that culminates with the weapon's deployment. On the contrary, only parts of the activities involved, if they become known in sufficient detail, would be enough to identify their purpose and betray the violation of the agreement. This process of detection and identification is facilitated in a number of ways by the natural synergy among the various means of gathering information from inside the U.S.S.R. Information gathered by one monitoring system may be electronic intercep-
