Dna Vaccines:

DNA Vaccines Douglas B. Lowrie, Robert Whalen, 2008-02-01 The field of DNA vaccines has undergone explosive growth in the last few years. As usual, some historical precursors of this approach can be discerned in the scientific literature of the last decades. However, the present state of affairs appears to date from observations made discreetly in 1988 by Wolff Malone Felgner and colleagues which were described in a 1989 patent and published in 1990. Quite surprisingly, they showed that genes carried by pure plasmid DNA and injected in a saline solution hence the epithet naked DNA could be taken up and expressed by skeletal muscle cells with a low but reproducible frequency. Such a simple methodology was sure to spawn many applications. In a separate and important line of experimentation, Tang De Vit and Johnston announced in 1992 that it was indeed possible to obtain humoral immune responses against proteins encoded by DNA delivered to the skin by a biolistic device which has colloquially become known as the gene gun. The year 1993 saw the publication of further improvements in the methods of naked DNA delivery and above all the first demonstrations by several groups of the induction of humoral and cytotoxic immune responses to viral antigens expressed from injected plasmid DNA. In some cases, protection against challenge with the pathogen was obtained. The latter result was unquestionably the touchstone of a method of vaccination worthy of the name. *Vaccines for Biodefense and Emerging and Neglected Diseases* Alan D.T.

Barrett, Lawrence R. Stanberry, 2009-03-05 The last 20 years has seen a rapid increase in infectious diseases particularly those that are termed emerging diseases such as SARS, neglected diseases such as malaria and those that are deemed biothreats such as anthrax. It is well recognized that the most effective modality for preventing infectious diseases is vaccination. This book provides researchers with a better understanding of what is currently known about these diseases including whether there is a vaccine available or under development. It also informs readers of the key issues in development of a vaccine for each disease. Provides a comprehensive treatise of the agents that are responsible for emerging and neglected diseases and those that can be used as biothreats. Includes the processes such as the vaccine development pathway, vaccine manufacturing and regulatory issues that are critical to the generation of these vaccines to the marketplace. Each chapter will include a map of the world showing where that particular disease is naturally found.

DNA Vaccines Mark W. Saltzman, Hong Shen, Janet L. Brandsma, 2008-02-02 In the early 1990s, almost 200 years after Edward Jenner demonstrated the effectiveness of the smallpox vaccine, a new paradigm for vaccination emerged. The conventional method of vaccination required delivery of whole pathogens or structural subunits, but in this new approach, DNA or genetic information was administered to elicit an immunological response. Once it was observed that plasmid DNA delivered in vivo led to production of an encoded transgene, 1. two ground-breaking studies demonstrated that immunological responses could be generated against antigenic transgenes via plasmid DNA delivered by DNA vaccination, as this approach is called 2. 3. The appearance of this new vaccination strategy coincided with advances in molecular biology which provided new tools to study and

manipulate the basic elements of an organism's genome and also could also be applied to the design and production of DNA vaccines DNA Vaccines is a major updated and enhancement of the first edition It reviews state of the art methods in DNA vaccine technology with chapters describing DNA vaccine design delivery systems adjuvants current applications methods of production and quality control Consistent with the approach of the Methods in Molecular Medicine series these chapters contain detailed practical procedures on the latest DNA vaccine technology The enthusiasm for DNA vaccine technology is made clear by the number of research studies published on this topic since the mid 1990s [DNA Vaccination/Genetic Vaccination](#) Hilary Koprowski, David B. Weiner, 2012-12-06 Genetic DNA immunization represents a novel approach to vaccine and immune therapeutic development The direct injection of nucleic acid expression cassettes into a living host results in a limited number of its cells becoming factories for production of the introduced gene products This host inappropriate gene expression has important immunological consequences resulting in the specific immune activation of the host against the gene delivered antigen The recent demonstration by a number of laboratories that the induced immune responses are functional in experimental models against both specific infectious diseases and cancers is likely to have dramatic consequences for the development of a new generation of experimental vaccines and immune therapies This technology has the potential to enable the production of vaccines and immune based therapies that are not only effective immunologically but are accessible to the entire world rather than just to the most developed nations Vaccine Development Vaccination against pathogenic microorganisms represents one of the most important advances in the history of medicine Vaccines including those against polio measles mumps rubella hepatitis A hepatitis B pertussis and other diseases have dramatically improved and protected more human lives than any other avenue of modern medicine The vaccine against smallpox for example has been so successful that it is now widely believed that this malicious killer responsible for more deaths in the twentieth century than World Wars I and II combined has been removed from the face of the earth **New Insights in Nucleic Acid Approaches for Vaccine and Biologic Delivery** Ebony Gary, David Weiner, 2026-03-26 The use of the nucleic acid platform for antigen delivery has expanded rapidly in the past decade highlighted by the development and deployment of several nucleic acid vaccines for SARS CoV 2 and the recent Nobel Prize in Medicine for the development of mRNA vaccines Several clinical trials evaluating this important platform in the context of other infectious diseases are ongoing The nucleic acid platform also supports the delivery of biologics RNA and DNA encoded monoclonal antibodies and biologics represent a cost effective potentially dose sparing delivery method which could decrease production costs and patient discomfort Similarly clinical trials evaluating the use of DNA and RNA to deliver biologics in the context of infectious diseases and cancer immunotherapy have begun While DNA delivery has been under investigation for a longer period several challenges related to expression remain Similarly lipid nanoparticle mediated mRNA delivery supports robust immunogenicity but patient tolerability concerns remain The goal of this Research Topic is to critically examine nucleic acid

based approaches for vaccine and biologic delivery in the treatment of cancer and genetic metabolic and infectious diseases We also welcome studies focused on using the nucleic acid platform for vaccine and adjuvant delivery and those identifying novel delivery methods thereof We are interested in Original Research Clinical Trial Mini Review and Systematic Review articles focusing on but not limited to the following areas Preclinical studies comparing traditional delivery platforms to nucleic acid delivery platforms for antibody and biologic delivery Preclinical and clinical studies demonstrating the efficacy of the nucleic acid platform for biologic delivery in the context of cancer and infectious diseases Mechanistic and pharmacokinetic studies of gene delivered monoclonal antibodies and biologics Identification of novel delivery methods for nucleic acid delivered biologics and vaccine antigens Identification of molecular mechanisms to enhance and prolong nucleic acid delivered protein expression in vivo Mechanistic studies characterizing in vivo expression profiles of nucleic acid delivered antigens and biologics Studies comparing traditional protein and viral vectored vaccine approaches with nucleic acid based approaches Identification of novel genetic adjuvants and their evaluation in the context of nucleic acid vaccines

DNA Vaccines Arthur M. Dixon, 2011 DNA vaccination is one of the most promising techniques for immunisation against diseases caused by viruses protozoa bacteria and even for tumours and illnesses with genetic origins These vaccines can be administered by direct inoculation of plasmid by several routes In this book the authors present topical research in the study of the types advantages and limitations of DNA vaccines Topics discussed include the role of novel carrier constructs in effective and safe DNA vaccine delivery improving the immunogenicity of DNA vaccines the role of DNA IL 12 vaccination in cosinphilic inflammation genetic immunisation enabling re direction of the host immune system resulting in the development of effective immune responses and DNA vaccination against herpesvirus

DNA Vaccines Margaret A. Liu, Maurice R. Hilleman, Reinhard Kurth, 1995 This conference provides an evaluation of current research on the powerful new technology of DNA vaccines DNA vaccines hold great promise for prevention and immunotherapy of viral and parasitic infections and

cancer particularly those diseases for which development of traditional vaccines has proved difficult Preclinical studies recently demonstrated the potential for polynucleotides encoding proteins from pathogens to be a novel and effective means of vaccination generating cellular and antibody responses while avoiding the potential risks of approaches utilising live viruses

Corbel, Elwyn Griffiths, 2000 This volume contains contributions describing the application of all the principal methods currently in use for evaluating carbohydrate lipopolysaccharide lipid protein glycoprotein and lipoprotein components of vaccines whether produced by conventional methods or recombinant technology It is clear from the information presented that this approach is gaining momentum and that we are seeing only the beginning of its impact in the field of vaccines and vaccinology

Advances in DNA Vaccines Maria G Isaguliantis, Karl Ljungberg, 2021-08-30 DNA is a rapidly developing vaccine platform for cancer and infectious and non infectious diseases

Plasmids are used as immunogens to encode proteins to be further synthesized in vaccine recipients DNA is mainly synthetic ensuring enhanced expression in the cells of vaccine recipients mostly mammals Their introduction into the host induces antibody and cellular responses The latter are often more pronounced and mimic the events occurring in infection especially viral There are a few distinct ways in which the vaccine antigen can be processed and presented which determine the resulting immune response and which can be manipulated Routinely the antigen synthesized within the host cell is processed by proteasome loaded onto and presented in a complex with MHC I molecules Processing can be re routed to the lysosome or immunogen can be secreted for further presentation in a complex with MHC II Apart from expression vaccination efficacy depends on DNA delivery DNA immunogens are generally administered by intramuscular or intradermal injections usually followed by electroporation which enhances delivery 1000 fold Other techniques are also used such as noninvasive introduction by biojectors skin applications with plasters and microneedles chips sonication magnetofection and even tattooing An intense debate regarding the pros and cons of different routes of delivery is ongoing A number of studies have compared the effect of delivery methods at the level of immunogen expression and the magnitude and specificity of the resulting immune response According to some the delivery route determines immunogenic performance according to others it can modulate the level of response but not its specificity or polarity The progress of research aiming at the optimization of DNA vaccine design delivery and immunogenic performance has led to a marked increase in their efficacy in large species and humans New DNA vaccines for use in the treatment of infectious diseases cancer allergies and autoimmunity are forthcoming This Special Issue covers various aspects of DNA vaccine development *AIDS Research and Human Retroviruses* ,1997 *Synthesis and Development of a Multiplex Vaccine for Patients with Melanoma* Anthony Ernest Maida,2010 **Materials Science and Intelligent Technologies Applications** Khanittha Wongseedakaew,Qi Luo,2014-10-08 Selected peer reviewed papers from the 2014 3rd International Conference on Key Engineering Materials and Computer Science KEMCS 2014 August 5 6 2014 Singapore *The Journal of Immunology* ,2008
