**Abstract** – The rise and fall of sea levels which is caused by the combined effects of the gravitational forces exerted by the sun and the moon, and the rotation of the Earth are known as Tides. As we are progressing with technology the usage of electric and electronic devices is exponentially increasing and there is a need to produce extra power other than the existing power sources so as to meet the future demands.

Tidal energy is considered as one of the best renewable sources of energy which exists presently. Tidal energy is something that has a long-term perspective, and it can be forecasted more accurately as compared to other renewable sources of energy i.e., wind, thermal, solar energy, etc. Tidal energy is non-polluting and renewable. Because of these characteristics, it is unique and appropriate for future usage as a power generating source. Around the world, many types of tidal power plants exist, each with a different tidal elevation. In addition, the process of converting tidal energy into electrical energy varies by location. However, the technology used to harvest energy from tides is typically identical to that used in traditional hydroelectric power plants.

**Key Words:** Tides, Tidal Energy, Power generation, electrical energy.

### 1. INTRODUCTION

Tidal energy a.k.a Tidal power, is a form of hydropower that converts the energy of tides into electricity or other useful forms of power.

Although not often used today, tidal power has the potential to provide electricity in the future. Wind and solar energy are less predictable than tides. Tidal power has traditionally had a high cost and restricted availability of locations with sufficiently large tidal ranges or flow velocities, limiting its total availability among renewable energy sources. However, many recent technological advancements and improvements, both in design (e.g., dynamic tidal power, tidal lagoons) and turbine technology (e.g., new axial turbines, cross flow turbines), suggest that total tidal energy availability may be much higher than previously assumed, and that economic and environmental costs may be dragged down to realistic prices.

Tidal power is usually generated by building a dam across a tidal basin's entrance. The dam has a gate that opens to enable the tide to flow into the basin; the gate then closes, and typical hydropower technologies may be utilized to

produce electricity from the raised water in the basin when the sea level decreases.

### 2. LITERATURE REVIEW

[1] For populations living near tidal bodies of water, tidal energy provides a clean, green, renewable, and efficient source of energy. Tidal energy is a promising, dependable, and environmentally friendly source of energy. There are several potential sites throughout the world that need to be investigated for the installation of tidal current turbines. India has a lot of promise when it comes to producing energy from renewable sources (RES).

[2] For power extraction from free or ultra-low head water flow, the tidal energy sector must create a new generation of efficient, low-cost, and ecologically friendly equipment. The negative environmental effects of tidal barrages are likely to be substantially lower than previously thought, those of other power sources, although they are not fully understood at the moment. It is essential to consider the impact of energy extraction when calculating available resources. Energy derived from a possible tidal energy location.

### 3. TIDAL ENERGY GENERATOR

Tidal energy is generated by the movement of our tides and seas, where the intensity of the water from tidal rise and fall is a type of kinetic energy. Tidal power is a subset of gravitational hydropower, which uses the flow of water to propel a turbine and create energy. The turbines are similar to wind turbines; however, they are located underwater.

Tidal energy can be obtained using three methods: tidal streams, barrages, tidal lagoons.

#### 3.1 Tidal Streams

A tidal stream is a fast-flowing body of water caused by the tides. A turbine is a device that uses a fluid flow to draw out energy. This fluid might be either air (wind) or liquid (water). Tidal energy is more potent than wind energy because water is considerably denser than air. Tides, unlike wind, are predictable and steady. Tidal generators generate a consistent, dependable supply of energy wherever they are utilised.
