Cascades And Fields In Perceptual Psychophysics:

Cascades and Fields in Perceptual Psychophysics Robert Anthony Mills Gregson,1995 Psychophysics is by definition mappings between events in the environment and levels of human sensory responses In this text the methods of nonlinear dynamics employing trajectories developed for simpler sensory modelling are extended to classes of problems which lie at the interface between sensation and perception A diversity of topics for which extensive empirical evidence exists are reformulated by writing their dynamics in terms of complex trajectories put into coupled lattices and into cascades of such lattices Fundamental relationships between core processes of psychophysics in time and space and recurrent quantitative or topological distortions of the physical world which arise in perception are given a treatment which contrasts fundamentally with traditional linear equations in use since the 19th century

Toward a Unified Theory of Development John P. Spencer,Michael S.

C. Thomas,James L. McClelland,2009 From William James to Sigmund Freud to Jean Piaget to B F Skinner scholars and

parents have wondered how children move from the blooming buzzing confusion of infancy through the tumult of childhood

and adolescence into adulthood Does development occur continuously over time or in a series of dramatic stages Is

development driven by learning or by biological maturational processes What is the nature of experience and how does it generate change The study of development has always been organized around these big questions And answers to these questions have a profound influence on daily life forming a framework for how parents think about their own children and influencing both national policy and educational curricula This book defines and refines two major theoretical approaches within developmental science that address the central issues of development connectionism and dynamical systems theory Spencer Thomas and McClelland have brought together chapters that provide an introduction overview and critical evaluation of each approach including three sets of case studies that illustrate how both approaches have been used to study topics ranging from early motor development to the acquisition of grammar They also present a collection of commentaries by leading scholars which offer a critical view from both an outsiders s and an insider s perspective The book is unique in the range of its treatment it begins to delineate how developmental science can incorporate advances within neuroscience and computational modeling and brings the new ideas of connectionism and dynamic systems theory into sharper focus clarifying their usefulness and explanatory power *Journal of the Optical Society of America* ,1979 **Maturational Windows And Adult Cortical Plasticity** B.
