

# Riemann Surface

A Riemann surface is a surface-like configuration that covers the **complex plane** with several, and in general infinitely many, "sheets." These sheets can have very complicated structures and interconnections (Knopp 1996, pp. 98-99). Riemann surfaces are one way of representing **multiple-valued functions**; another is **branch cuts**. The above plot shows Riemann surfaces for solutions of the equation

$$[w(z)]^d + w(z) + z^{d-1} = 0$$

**Quasiconformal Mappings, Riemann Surfaces, and Teichmüller Spaces** Yunping Jiang, 2012 This volume contains the proceedings of the AMS Special Session on Quasiconformal Mappings Riemann Surfaces and Teichmüller Spaces held in honor of Clifford J Earle from October 2 3 2010 in Syracuse New York This volume includes a wide range of papers on Teichmüller theory and related areas It provides a broad survey of the present state of research and the applications of quasiconformal mappings Riemann surfaces complex dynamical systems Teichmüller theory and geometric function theory The papers in this volume reflect the directions of research in different aspects of these fields and also give the reader an idea of how Teichmüller theory intersects with other areas of mathematics **Conformal Maps of a Riemannian Surface into the Space of Quaternions** Dr. Jörg Richter, 1997-09-01 In the present work a coordinate free way is suggested to handle conformal maps of a Riemannian surface into a space of constant curvature of maximum dimension 4 modeled on the non commutative field of quaternions This setup for the target space and the idea to treat differential 2 forms on Rie

Riemannian surfaces as quadratic functions on the tangent space are the starting points for the development of the theory of conformal maps and in particular of conformal immersions. As a first result, very nice conditions for the conformality of immersions into 3 and 4 dimensional space forms are deduced and a simple way to write the second fundamental form is found. If the target space is Euclidean 3 space, an alternative approach is proposed by fixing a spin structure on the Riemannian surface. The problem of finding a local immersion is then reduced to that of solving a linear Dirac equation with a potential whose square is the Willmore integrand. This allows to make statements about the structure of the moduli space of conformal immersions and to derive a very nice criterion for a conformal immersion to be constrained Willmore. As an application, the Dirac equation with constant potential over spheres and tori is solved. This yields explicit immersion formulae out of which there were produced pictures of the Dirac spheres and tori. These immersions have the property that their Willmore integrand generates a metric of vanishing and constant curvature respectively. As a next step, an affine immersion theory is developed. This means one starts with a given conformal immersion into Euclidean 3 space and looks for new ones in the same conformal class. This is called a spin transformation and it leads one to solve an affine Dirac equation. Also, it is shown how the coordinate dependent generalized Weierstrass representation fits into the present framework. In particular, it is now natural to consider the class of conformal immersions that admit new conformal immersions having the same potential. It turns out that all geometrically interesting immersions admit such an isopotential spin transformation and that this property of an immersion is even a conformal invariant of the ambient space. It is shown that conformal isothermal immersions generate both via their dual and via Darboux transformations non-trivial families of new isopotential conformal immersions. Similarly, to this conformal constrained Willmore immersions produce non-trivial families of isopotential immersions of which subfamilies are constrained Willmore again having even the same Willmore integral. Another observation is that the Euler-Lagrange equation for the Willmore problem is the integrability condition for a quaternionic 1-form which generates a conformal minimal immersion into hyperbolic 4 space. Vice versa, any such immersion determines a conformal Willmore immersion. As a consequence, there is a one-to-one correspondence between conformal minimal immersions into Lorentzian space and those into hyperbolic space which generalizes to any dimension. There is also induced an action on conformal minimal immersions into hyperbolic 4 space. Another fact is that conformal constant mean curvature (CMC) immersions into some 3 dimensional space form unveil to be isothermal and constrained Willmore. The reverse statement is true at least for tori. Finally, a very simple proof of a theorem by R. Bryant concerning Willmore spheres is given. In the last part, time dependent conformal immersions are considered. Their deformation formulae are computed and it is investigated under what conditions the flow commutes with Möbius transformations. The modified Novikov-Veselov flow is written down in a conformal invariant way and explicit deformation formulae for the immersion function itself and all of its invariants are given. This flow commutes with Möbius transformations. Its definition is coupled with a  $\bar{\partial}$  problem for which a so

lution is presented under special conditions These are fulfilled at least by cmc immersions and by sur faces of revolution and the general flow for mulae reduce to very nice formulae in these cases

*Lectures on Quasiconformal Mappings* Lars Valerian Ahlfors, 2006-07-14 Lars Ahlfors s Lectures on Quasiconformal Mappings based on a course he gave at Harvard University in the spring term of 1964 was first published in 1966 and was soon recognized as the classic it was shortly destined to become These lectures develop the theory of quasiconformal mappings from scratch give a self contained treatment of the Beltrami equation and cover the basic properties of Teichmuller spaces including the Bers embedding and the Teichmuller curve It is remarkable how Ahlfors goes straight to the heart of the matter presenting major results with a minimum set of prerequisites Many graduate students and other mathematicians have learned the foundations of the theories of quasiconformal mappings and Teichmuller spaces from these lecture notes This edition includes three new chapters The first written by Earle and Kra describes further developments in the theory of Teichmuller spaces and provides many references to the vast literature on Teichmuller spaces and quasiconformal mappings The second by Shishikura describes how quasiconformal mappings have revitalized the subject of complex dynamics The third by Hubbard illustrates the role of these mappings in Thurston s theory of hyperbolic structures on 3 manifolds Together these three new chapters exhibit the continuing vitality and importance of the theory of quasiconformal mappings

*Moduli of Families of Curves for Conformal and Quasiconformal Mappings* Alexander Vasil'ev, 2002-07-23 The monograph is concerned with the modulus of families of curves on Riemann surfaces and its applications to extremal problems for conformal quasiconformal mappings and the extension of the modulus onto Teichmuller spaces The main part of the monograph deals with extremal problems for compact classes of univalent conformal and quasiconformal mappings Many of them are grouped around two point distortion theorems Montel s functions and functions with fixed angular derivatives are also considered The last portion of problems is directed to the extension of the modulus varying the complex structure of the underlying Riemann surface that sheds some new light on the metric problems of Teichmuller spaces

*Classification Theory of Riemann Surfaces* Leo Sario, Mitsuru Nakai, 2012-12-06 The purpose of the present monograph is to systematically develop a classification theory of Riemann surfaces Some first steps will also be taken toward a classification of Riemannian spaces Four phases can be distinguished in the chronological background the type problem general classification compactifications and extension to higher dimensions The type problem evolved in the following somewhat overlapping steps the Riemann mapping theorem the classical type problem and the existence of Green s functions The Riemann mapping theorem laid the foundation to classification theory there are only two conformal equivalence classes of noncompact simply connected regions Over half a century of efforts by

leading mathematicians went into giving a rigorous proof of the theorem RIEMANN WEIERSTRASS SCHWARZ NEUMANN POINCARÉ HILBERT WEYL COURANT OSGOOD KOEBE CARATHÉODORY MONTEL The classical type problem was to determine whether a given simply connected covering surface of the plane is conformally equivalent to the plane or the disk The problem was in the center of interest in the thirties and early forties with AHLFORS KAKUTANI KOBAYASHI P MYRBERG NEVANLINNA SPEISER TEICHMüller and others obtaining incisive specific results The main problem of finding necessary and sufficient conditions remains however unsolved
