Affiliative social bonds are linked to fitness components in many social mammals. However, despite their importance, little is known about how the tendency to form social bonds develops in young animals, or if the timing of development is heritable and thus can evolve. Using four decades of longitudinal observational data from a wild baboon population, we assessed the environmental determinants of an important social developmental milestone in baboons—the age at which a young animal first grooms a conspecific—and we assessed how the rates at which offspring groom their mothers develops during the juvenile period. We found that grooming development differs between the sexes: female infants groom at an earlier age and reach equal rates of grooming with their mother earlier than males. We also found that age at first grooming for both sexes is weakly heritable ($h^2 = 0.043$, 95% CI: 0.002–0.110). These results show that sex differences in grooming emerge at a young age; that strong, equitable social relationships between mothers and daughters begin very early in life; and that age at first grooming is heritable and therefore can be shaped by natural selection.

1. Background

Observational studies of humans and other mammals indicate that individuals with more numerous or stronger social bonds in adulthood are healthier and live longer, suggesting that strong social relationships should be favoured via natural selection [1,2]. Social relationships in early life are also important, as they represent crucial opportunities to develop social skills and may have long-lasting consequences in their own right. For instance, in social mammals, positive social environments early in life have been linked to stronger or more numerous affiliative social relationships in adulthood [3–6], better health [3,7] and increased longevity [8–12].

In spite of the well-established importance of social bonds in mammals, very little is known about the ontogeny of affiliative social behaviours in natural populations—including the relative contributions of demography, environment and genetics during development. Sex differences are among the best-understood aspects of the development of social behaviour [13–17]. For example, in juvenile meerkats, females invest more in cooperative care of young, and in several species of primates, juvenile females invest more in grooming relationships,
