Signaling in the Heart José Marín-García, 2011-06-21 Signal transduction pathways are at the core of most biological processes and are critical regulators of heart physiology and pathophysiology The heart is both a transmitter and dynamic

receptor of a variety of intracellular and extracellular stimuli playing a critical role of an integrator of diverse signaling mechanisms Alterations in signaling pathways are contributing factors in the development and progression of a broad spectrum of diseases ranging from dysrhythmias and atherosclerosis to hypertension and the metabolic syndrome Targeting specific components of these signaling pathways has been shown to be effective in preclinical studies with significant therapeutic impact This book brings together current knowledge in cardiovascular cell signal transduction mechanisms advances in novel therapeutic approaches to improve cardiac function and discussion of future directions Presented from a post genomic perspective this exciting book introduces important new ideas in cardiovascular systems biology It is an invaluable reference for cardiology researchers and practitioners

Cardiovascular Development Rolf Bodmer,2008 In 1993 Rolf Bodmer described a gene he named tinman that was required for the formation of the dorsal aorta of the fly Flies without a functional tinman gene had no heart Quickly mammalian counterparts of the tinman gene were identified and found to be expressed by early cardiomyogenic precursors and by cardiomyocytes throughout heart development Since then significant progress has been made in the understanding of molecular and genetic determinants of heart formation An ever growing number of genes have been identified that are required for cardiogenesis as evidenced by severe abnormalities in cardiac development produced by inactivation in the mouse or inhibition of gene function in other model organisms Cardiovascular Development covers some of the latest research in the study of heart formation Volume Editor Rolf Bodmer has assembled a world class list of contributors whose research uses a variety of animal models and whose findings are certain to enhance our understanding of this exciting field Ties together the development of heart morphology and conduction system The latest developments in vertebrate and invertebrate genetic model systems Technological advancements in cardiovascular science

Development of the Hypertensive Phenotype David A. Blizard, Richard McCarty, Robert L. Chevalier,1999 Hardbound The present volume of the Handbook of Hypertension draws together knowledge on the endogenous genetic and exogenous environmental components contributing to the pathogenesis of essential hypertension In the field of hypertension research the importance of adopting a genetic approach to its phenomenology was recognized at an early stage There was early debate concerning the nature of the genetic architecture underlying population variability in blood pressure but today its polygenic nature is generally accepted and is reflected in the design and orientation of human investigations as well as in the heterogeneity of mechanisms that have been unearthed by exploration with diverse animal genetic models Concurrently epidemiological studies have emphasized the contribution of a variety of environmental factors in the etiology of hypertension In particular the contribution of dietary factors smoking and lifestyle to the develop
